**IMPORTANT:** Many oil filters require different installation techniques; therefore it is imperative that the instructions on each filter be followed.

All information contained within this document is accurate at time of printing. For the most current part number listing, visit [www.moparrepairconnection.ca](http://www.moparrepairconnection.ca).

To determine the correct engine application on Chrysler, Ford or GM products manufactured from 1972–80, use the fifth character on the VIN plate. If it was manufactured from 1981–96, use the eighth character on the VIN plate located on the dash panel.

**IMPORTANT:** Plusieurs filtres à huile exigent une technique d'installation différente et de ce fait, il importe de suivre les directives données sur chaque filtre.

Toutes les informations contenues dans ce document sont exactes au moment de l'impression. Pour obtenir la plus récente liste de numéro de pièce, visitez [www.moparrepairconnection.ca](http://www.moparrepairconnection.ca).

Pour déterminer le moteur approprié à un produit Chrysler, Ford ou GM fabriqué entre 1972 et 1980, utilisez le 5<sup>e</sup> caractère inscrit sur la plaque du NIV. Si le véhicule a été fabriqué entre 1981 et 1996, utilisez le 8<sup>e</sup> caractère inscrit sur la plaque du NIV sur le tableau de bord.

# PRODUCT INFORMATION

## Explain The Benefits

### Oil Filters

Regular oil filter replacement is important to remove abrasive particles which could accelerate engine wear. Most car manufacturers recommend changing twice as often when vehicle is used in stop and go traffic, short trips or dusty conditions.

### Air Filters

Fuel economy and good performance can only be achieved with a clean air filter. Refer to the Owners Manual for the manufacturer's service recommendations.

### Gasoline Filters

To avoid rough engine idling, stalling and poor acceleration due to a clogged gasoline filter, the filter should be replaced twice per year.

### Cabin Air Filters

Designed to remove airborne particles to provide cleaner air in the passenger compartment, remove foul odors, reduce allergy related problems and improve the vehicle's heating and air-conditioning performance. Refer to the Owners Manual for the manufacturer's service recommendations.

*"Clogged Filters Cost the Customer Money"*

## Ask For The Sale!

### Find the need

- Best opportunity for selling filters is at the time of an oil change or engine tune-up. The customer is likely to be most interested in the needs of his vehicle at these times.
- Look for a "lube sticker" showing date or mileage of the last filter change.

# INFORMATION SUR LE PRODUIT

## Expliquez les avantages

### Filtres à huile

Le remplacement régulier des filtres à huile est important afin d'éliminer les particules abrasives qui pourraient accélérer l'usure du moteur. La plupart des fabricants automobiles recommande de remplacer le filtre deux fois plus souvent lorsque le véhicule est utilisé dans des conditions de circulation difficile, de routes poussiéreuses ou pour de courts trajets.

### Filtres à air

L'économie de carburant et la bonne performance ne peuvent être atteintes sans un filtre à air propre. Reportez-vous au manuel de propriétaire pour les recommandations de service du fabricant.

### Filtres à essence

Afin d'éviter la marache au ralenti inégale, le calage ou l'accélération faible du moteur pour cause d'un filtre à essence cambouisé, le filtre devrait être remplacé deux fois par année.

### Filtres à air d'habitacle

Conçu pour éliminer les particules en suspension pour fournir un air propre dans l'habitacle, enlever les mauvaises odeurs, réduire les problèmes d'allergie liés et améliorer le chauffage et la climatisation de la performance du véhicule. Reportez-vous au manuel de propriétaire pour les recommandations de service du fabricant.

*"des filtres obstrués coûtent cher au client"*

## Demandez pour la vente!

### Découvrez le besoin

- L'occasion idéale de vendre des filtres est lors d'un vidange d'huile ou d'une mise au point du moteur. Le client sera alors porté à être plus intéressé dans les besoins de son véhicule.
- Repérez l'étiquette collante de lubrification qui indiquera la date ou le kilométrage depuis le dernier remplacement du filtre.

# Over-Pressurized Lube Oil Filters

From time to time, every filter manufacturer has had a filter that has been severely over-pressurized returned from a customer. Often the deformed filter is the only sign the car owner had that a problem existed in his lube oil system. It is possible that the damaged filter was not noticed until it was removed during the next scheduled oil change. However, if the pressure was sufficient to blow out the gasket or unroll the lockseam, the car owner may have experienced immediate and costly problems.

With the “evidence” in his hands, he tends to put the blame on the damaged filter. It is not surprising that he is more than a little aggravated when the filter manufacturer denies any responsibility for the damage. What, then, has caused the over-pressurization?

A look at how a lube oil system functions will show that oil pressure is created by the oil pump. The upper limit of this pressure is controlled by a pressure-regulating valve which is usually an integral part of the pump.

**Figure 1** is a simplified diagram of the lube oil system showing the pump, regulating valve, filter and bearings. The pump supplies sufficient flow to lubricate the bearings and other moving parts of the engine. This oil must be under pressure if it is to properly separate the highly loaded parts of an engine and prevent excessive wear. The purpose of the regulating valve is to provide this pressure, which on most passenger cars is between 40 and 60 psi.

The regulating valve is made up of a ball or plunger which regulates pressure with the aid of a spring. The spring is calibrated so that the plunger will lift off its seat when the oil pressure reaches the desired amount. Once the valve is open, the pressure remains fairly constant with only small changes occurring as the engine speed varies.

The filter and all other components in the lube system are subjected to the pressure established by the regulating valve. If the pressure is excessive, filter damage may occur. This is the point that many people who are not familiar with lube systems fail to realize.

What can cause the pressure in the system to exceed the regulating valve setting? The answer is that either the valve must be stuck in the closed position, or it is sluggish and slow to move to the open position after the engine has started.

**Figure 2** shows the system operating with the regulating valve stuck in the shut position. Under these conditions the pressure builds up equally on all components in the system until something happens to relieve the pressure. If the regulating valve becomes unstuck, the pressure will return to normal. If it remains stuck, something has to break. Normal operating pressure causes no permanent deformation of the filter body. When the system pressure reaches 150 psi due to a faulty regulating valve, most filters become permanently deformed. At this pressure, the gasket usually will not blow out and the lockseam will remain sound.

If the regulating valve still remains stuck, the pressure will increase further and the gasket between the filter and the base can be blown out. This will probably cause the loss of all the oil in the system.

If the filter has been installed on the tight side, the gasket may not blow out and the lockseam will unwind as the pressure continues to rise.

If the customer is alert and shuts the engine off at the first sign of trouble (red light on or reduced oil pressure) they can limit their loss to a tow job, oil change and new filter.

If they drive to the nearest garage, they will probably burn up the engine due to lack of oil. The main point is that the deformed filter is not the cause of this excessive pressure, but is the victim of a faulty regulating valve. The customer may ask if a filter that is completely plugged could have caused the over-pressure conditions in the system. The answer is no. If the regulating valve is functioning properly it will maintain the pressure on the filter at 40 or 60 psi even if the filter is plugged.

In summary, if a filter distorts due to over-pressure in the system, the fault lies with the regulating valve and not with the filter.

# Filtres à huile lubrifiante surpressurisés

De temps à autre, chaque fabricant de filtres rencontre un filtre qui a été sévèrement surpressurisé et retourné par un client. Souvent, le filtre déformé constitue le seul indice que le propriétaire de la voiture possède pour lui indiquer un problème dans son système d'huile lubrifiante. Il est possible que le filtre endommagé ne soit pas remarqué avant la prochaine vidange d'huile. Si, toutefois, la pression a été suffisante pour déloger le joint ou dérouler le joint d'arrêt, le propriétaire de la voiture peut faire face à des problèmes immédiats et coûteux.

Avec la << preuve >> en main, il aura tendance à mettre le blâme sur le filtre endommagé. Il n'est pas surprenant qu'il soit plus qu'irrité lorsque le fabricant de filtres nie toute responsabilité pour les dommages. Alors, qu'est-ce qui a causé la surpressurisation?

Un coup d'oeil sur la façon dont un système d'huile lubrifiante fonctionne démontre que la pression d'huile est engendrée par la pompe à huile. La limite la plus élevée de cette pression est contrôlée par une soupape régulatrice de pression laquelle est normalement incorporée à la pompe.

**La Figure 1** constitue un schéma simplifié du système d'huile lubrifiante; on y voit la pompe, la soupape régulatrice, le filtre et les coussinets. La pompe fournit un débit suffisant pour lubrifier les coussinets et autres pièces mobiles du moteur. Cette huile doit se trouver sous pression afin de séparer adéquatement les pièces lourdes du moteur et prévenir une usure excessive. Le but de la soupape régulatrice est de fournir cette pression, laquelle, sur la plupart des voitures de tourisme, est de 40 à 60 lb/po<sup>2</sup>.

La soupape régulatrice est composée d'une bille, ou plongeur, qui contrôle la pression à l'aide d'un ressort. Le ressort est calibré de façon à permettre au plongeur de se soulever de son siège lorsque la pression d'huile atteint un niveau voulu. Une fois la soupape ouverte, la pression demeure passablement uniforme avec seulement quelques variations suivant la vitesse du moteur.

Le filtre, de même que tous les autres organes du système lubrifiant, sont soumis à la pression établie par la soupape régulatrice. Si cette pression devient excessive, le filtre peut être endommagé. Pour certaines personnes qui ne connaissant pas les systèmes lubrifiants, cette situation est difficile à comprendre.

Quelle est la cause de cet excès de pression par rapport au réglage de la soupape régulatrice? La réponse : soit la soupape est coincée en position fermée, soit elle est lente et prend trop de temps à s'ouvrir une fois que le moteur a démarré.

**La Figure 2** illustre le système fonctionnant avec la soupape régulatrice coincée en position fermée. Dans ces conditions, la pression s'accumule également sur tous les organes du système jusqu'à ce qu'il se produise quelque chose pour dégager la pression. Si la soupape régulatrice se décroince, la pression revient à la normale. Si elle demeure coincée, un bris se produira. Une pression de fonctionnement normale ne cause aucune déformation permanente sur le corps du filtre. Lorsque la pression du système atteint 150 lb/po<sup>2</sup> par suite d'une défectuosité dans la soupape régulatrice, la plupart des filtres se déforment d'une façon permanente. A ce niveau de pression, le joint ne lâchera pas et le joint d'arrêt restera en bon état.

Si la soupape régulatrice demeure toujours coincée, la pression augmentera de plus en plus et le joint se trouvant entre le filtre et la base peut lâcher, ce qui causera la perte de toute l'huile dans le système.

Si le filtre a été installé bien serré, le joint peut ne pas lâcher et le joint d'arrêt se déroulera alors que la pression continue de monter.

Si le client est vif et qu'il éteint le moteur au premier signe de problème, (voyant rouge allumé ou pression d'huile réduite), il peut limiter les dégâts et s'en tirer avec un simple remorquage de son véhicule, une vidange d'huile et nouveau filtre.

S'il conduit la voiture à la station-service la plus proche, le moteur surchauffera probablement à cause du manque d'huile. Le point le plus important à se rappeler est que le filtre déformé n'est pas la cause de cette pression excessive, mais plutôt le résultat d'une soupape régulatrice défectueuse. Le client demandera probablement si un filtre complètement bouché peut être la cause des conditions de surpression dans le système. La réponse est non. Si la soupape régulatrice fonctionne adéquatement, elle maintiendra la pression au filtre de 40 à 60 lb/po<sup>2</sup>, même si le filtre est bouché.

En conclusion, si un filtre se déforme par suite d'une surpression dans le système, le problème provient de la soupape régulatrice et non du filtre.

## NORMAL PRESSURE / PRESSION NORMALE

FIG. 1

## EXCESSIVE PRESSURE / PRESSION EXCESSIVE

FIG. 2

# One in four vehicles needs a new air filter.

## Does your customer's filter look like this?

Good performance and fuel economy can only be achieved with a clean air filter. An improperly functioning air filter can damage an engine by restricting airflow or allowing contaminants to enter. Air filters should be checked/inspected with every oil change and replaced at 25,000 kilometres or less if dirty.

### New Panel Style Air Filter

New filters should be free of rips, tears, punctures and excess contamination. Filters should be dry and the edges should be straight.

### Contaminated and Collapsed Air Filter

Inspect the filter media for excess contaminant accumulation, which can restrict airflow to the engine. Should the air filter become completely restrictive to airflow, it may collapse inward on itself due to high differential pressure between the inlet and outlet side of the filter housing. Filter collapse not only destroys the filter, it also allows free bypass of contaminants into the engine.

### Moistened Air Filter

Inspect the filter for wavy pleats, which can indicate possible moisture in the air intake system. Excess moisture in the air intake system can damage the filter and reduce its performance.

### Pinched Air Filter

Carefully inspect the filter's rubber seal for signs of being pinched in the filter housing. A pinched seal indicates the filter may have been improperly installed, which can cause excess contaminants to bypass the filter and enter the engine.

Also inspect filter media for tears, rips or punctures which can create a path for contaminants to enter the engine.

# Un véhicule sur quatre a besoin d'un nouveau filtre à air.

## Le filtre de vos clients ressemble-t-il à ceci ?

Un filtre à air propre permet de bonnes performances et une réduction de la consommation d'essence.

Un filtre à air en mauvais état peut endommager le moteur en réduisant le débit d'air ou en laissant entrer des contaminants. Le filtre à air devrait être inspecté à chaque vidange d'huile et remplacé tous les 25 000 kilomètres ou moins s'il est sale.

### Filtre à air neuf de style panneau

Les filtres à air neufs doivent être exempts de déchirures, de perforations et ne pas contenir trop de contaminants. Les filtres doivent être secs et les bords, droits.

### Filtre à air sale et affaissé

Inspectez la couche filtrante; un excès de saletés peut réduire le débit d'air au moteur. Lorsque le filtre à air empêche tout débit d'air, ce dernier peut alors s'affaisser en raison de la grande différence de pression de part et d'autre du boîtier du filtre. Le filtre est alors détruit et, par conséquent, laisse entrer des contaminants dans le moteur.

### Filtre à air humide

Inspectez le filtre afin d'y déceler des ondulations pouvant indiquer la présence d'humidité dans le système d'admission d'air. Un excès d'humidité dans le système d'admission d'air peut endommager le filtre et réduire ses performances.

### Filtre à air pincé

Inspectez minutieusement le joint de caoutchouc du filtre afin de détecter toute trace de pincement. Un joint pincé indique que le filtre peut avoir été mal installé et, ainsi, laisser entrer une trop grande quantité de contaminants dans le moteur.

De plus, inspectez la couche filtrante pour détecter la présence, de déchirures ou de perforations pouvant laisser entrer des contaminants dans le moteur.

# Have your customers gotten the most out of their cabin air filter?

**IF IT LOOKS LIKE THIS ... THEY PROBABLY HAVE.**

Cabin air filters purify the air that enters the vehicle through the HVAC system, trapping pollen, dust and allergens down to the 1 micron level. Replacing the cabin air filter at least every 20,000 km helps to prevent mould build-up in the HVAC system and ensures that your customers can breathe easy.

\*Actual filter image after 18,000 km road test

# Vos clients ont-ils profité de leur filtre à air d'habitacle ?

## S'IL A L'AIR DE CECI ... C'EST PROBABLEMENT LE CAS.

Les filtres à air d'habitacle purifient l'air qui entre dans le véhicule par le système de ventilation. Ils attrapent le pollen, la poussière et les allergènes de taille aussi petite qu'un micromètre. Le remplacement du filtre à air d'habitacle à tous les 20 000 km empêchera l'accumulation de moisissure à l'intérieur du système de ventilation et permettra ainsi à vos clients de mieux respirer.

\*L'image du filtre a été prise après un essai sur route de 18 000 km

# MOPAR<sup>MD</sup>. LA MARQUE DIGNE DE CONFIANCE EN MATIÈRE DE FILTRES À HUILE.

Lorsqu'il est question de filtres à huile, vous pouvez compter sur les filtres Mopar<sup>MD</sup> pour garder le moteur propre et lubrifié. Conçus selon les normes les plus rigoureuses, les filtres Mopar sont fabriqués avec des matériaux de qualité pour protéger les composants vitaux du moteur des dommages causés par la poussière et les saletés, pour une conduite plus fluide, silencieuse et écoénergétique.

Pour que les moteurs continuent de fonctionner à leur meilleur.

## CARTOUCHE DE FILTRE

Cette cartouche en acier haute résistance garde sa forme lorsque la pression est anormale.

## RESSORT HÉLICOÏDAL EN ACIER

Afin de veiller à ce que l'huile usagée ne pénètre pas de nouveau dans le moteur, des ressorts hélicoïdaux en acier sont utilisés pour maintenir l'étanchéité du couvercle d'embout supérieur.

## EMBOUTS

Les embouts en acier assurent une meilleure rigidité structurelle que les pièces de certains concurrents du marché secondaire.

## COUCHE FILTRANTE

Elle améliore la capacité du filtre à emprisonner et à retenir la saleté pouvant causer des dommages.

## TUBE CENTRAL EN ACIER

Ce composant aide à améliorer le flux d'huile propre, en plus d'offrir une résistance supérieure, quelles que soient les conditions.

## SOUPAPE DE DÉRIVATION DE SÉCURITÉ

Une soupape de dérivation de sécurité en amont empêche l'huile de passer si le filtre est bouché par de la saleté.

# MOPAR®. THE TRUSTED NAME IN OIL FILTERS.

When it comes to oil filters, trust Mopar® Brand Filters to keep engines clean and lubricated. Mopar Filters are engineered to the highest standards and use quality materials to protect an engine's vital components from the harm of dirt and dust, making the ride smoother, quieter and more fuel-efficient. Keep engines running their best. Use original Mopar Parts.

## FILTER CANISTER

This high-strength steel canister keeps its shape during abnormal pressure situations.

## COILED STEEL SPRING

To ensure dirty oil does not re-enter the engine, coiled steel springs are used to maintain a seal between the upper end cap.

## END CAPS

Steel end caps provide a stiffer structure than some aftermarket competitors.

## FILTER MEDIA

Improves the filter's ability to catch and hold dirt that can cause damage.

## STEEL CENTER TUBE

Helps increase the flow of clean oil and provides superior strength in all conditions.

## SAFETY BY-PASS VALVE

An upfront safety by-pass valve keeps oil away if the filter ever becomes plugged with dirt.
